

What are Libraries in Solidity?

- A library is a reusable collection of functions.
- Libraries help avoid code duplication.
- They cannot hold state (no storage variables).
- Libraries cannot be deployed like contracts.
- Library functions are called directly using the library name.
- Commonly used for utility and helper logic.

Why Do We Use Libraries?

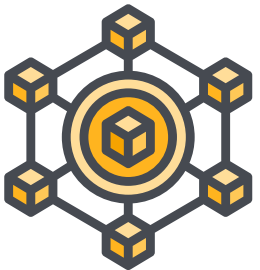

- To write clean and reusable code.
- To reduce contract size and gas cost.
- To improve security using audited code.
- To maintain consistency across projects.
- To separate logic from core contract code.

Where Do We Use Libraries?

- Common mathematical calculations
- String and address utilities
- Token logic (ERC20, ERC721)
- Security helpers (SafeMath, ReentrancyGuard)
- Large-scale DeFi and NFT projects

Library vs Contract

Library

- Reusable logic only, No storage variables,
Not deployed directly, Gas efficient

Contract

- Holds logic + state, Can store data,
Deployed normally, More gas usage
